

Manufacturer Cleaning Recommendation

Wilding Wallbeds takes great pride in its hardwood products. Its clinical products are not only strong and durable physically, but also in the department of infections control. Our Clinical Pro Series furnishings include finishes with Microban® (anti-microbial) protection to inhibit the growth of bacteria.

With regular care and maintenance, your Clinical Pro Series will provide a lifetime of satisfaction in its ability to perform in the Clinical environment.

These cleaning recommendations are offered as a service and are not a substitute for your facilities policies and procedures. Medical facilities should strictly adhere to their written policies and procedures as well as State and Federal mandated rules for cleaning and infection control.

Routine Cleaning

Clean furniture between patients. If furniture will not be occupied for a period of time it should be cleaned once per week.

- Always dust with a polish-moistened or damp cloth, following the grain of the wood. Remove residues with a soft, lint-free cloth and a mild detergent or soap and warm water.
- Detergents /disinfectants in clinical setting should be ones that are registered with the EPA.
- In the list of your facilities approved detergents/disinfectants, it is important for the longevity of the finishes on the Clinical Pro Series that you avoid the use of items containing bleach, ammonia, abrasive additives, petroleum based or alcohol based products.
- Keep wood surfaces dry. Wipe up spills, splatters and water spots as soon as they occur and dry surfaces immediately with a soft cloth

Periodic Cleaning

Periodic Cleaning can be regularly scheduled.

- This is a great time to look for small nicks or scratches in furniture.
- After using detergent/disinfectant that would be used in routine cleaning, it is a good time to rub down with light furniture polish (not silicones or waxes).
- Avoid furniture polishes that contain petroleum distillates or dyes. This process will leave your furnishings with a bright luster that looks like it was just installed.

Incidental Cleaning

With incidental cleaning it is very important to refer to the strict guidelines outlined by your facilities. Especially for spills involving bodily fluids (such as blood) making sure that safety for product and the person cleaning it is adhered to.
